Functional Specification (Sample)

Open Purchase Order Ageing Report with Release Status | Author: Manikandan S

Sample document using an imaginary requirement and dummy data. It shows the standard structure of a functional specification handed to the ABAP team.

1. Document control

Field	Value
Document title	FS - Open PO Ageing Report with Release Status
Module	SAP MM
Type	Custom report (new development)
Version	1.0 (sample)
Author	Manikandan S
Reviewer / Approver	Business process owner (sample)

2. Business requirement

Purchasing managers need one report that lists all open Purchase Orders with the number of days overdue and the current release status. Today they check ME2N and ME23N separately, which takes time and misses overdue items.

3. Scope

- **In scope:** open PO items (not fully received) for selected plants and purchasing groups; ageing in days; release status; export to Excel.
- **Out of scope:** changes to PO documents, automatic e-mails, and service POs (phase 2).

4. Proposed solution

Create an ALV report that reads open PO schedule lines, calculates the delay against the delivery date and shows the release status of each PO.

5. Selection screen

Field	Technical ref	Type	Mandatory
Company code	EKKO-BUKRS	Select-option	Yes
Plant	EKPO-WERKS	Select-option	Yes
Purchasing group	EKKO-EKGRP	Select-option	No
Vendor	EKKO-LIFNR	Select-option	No
PO date	EKKO-BEDAT	Date range	No
Release status	EKKO-FRGZU / FRGKE	Dropdown: All, Released, Pending	No

6. Output fields

Column	Source	Logic
PO number / item	EKPO-EBELN / EBELP	Direct
Vendor and name	EKKO-LIFNR, vendor master	Name read from business partner / vendor
Material and description	EKPO-MATNR, TXZ01	Direct
Ordered quantity	EKPO-MENGE	Direct

Column	Source	Logic
Open quantity	EKPO-MENGE minus received qty (EKBE, movement 101 net of 102)	Calculated
Delivery date	EKET-EINDT	Latest schedule line date
Days overdue	Today minus delivery date	Show 0 if not yet due
Release status	EKKO-FRGKE, FRGZU	Show text: Released / Pending / Not applicable

7. Processing logic

- Select PO items from EKKO and EKPO for the entered selection criteria, excluding deleted items and items marked delivery completed.
- Read schedule lines from EKET and goods receipt history from EKBE.
- Calculate open quantity; keep only items with open quantity greater than zero.
- Calculate days overdue as today minus delivery date, shown only when positive.
- Map release fields to a readable status.
- Display in ALV grid with sorting, filtering, totals on open quantity and Excel export.

8. Authorization and performance

- Check plant-level authorization (object M_BEST_WRK) before showing data.
- Use selection-based database access and avoid loops that read the database per row.
- Target: report runs in under 30 seconds for up to 50,000 PO items (sample target).

9. Test scenarios

No.	Scenario	Expected result
1	PO fully received	Not shown in report
2	PO partly received, delivery date in the past	Shown with correct open quantity and overdue days
3	PO pending release	Release status shows Pending
4	User without authorization for a plant	No data for that plant
5	Excel download	File contains the same columns and rows as the screen

10. Assumptions

- Goods receipt is posted against the PO using movement type 101.
- Release strategy is active for the plants in scope.
- Table and field names are standard S/4HANA; exact names should be confirmed with the ABAP team.

All names, values and targets are dummy examples.
